

CARBON MONOXIDE POISONING

Carbon monoxide poisoning is a medical emergency treated with hyperbaric oxygen therapy. Caused by exposure from fire, propane, heaters, or exhausts in a tight, poorly ventilated space, carbon monoxide poisoning is an excess of the colorless, odorless gas in the bloodstream. Carbon monoxide is considered a dual poison because it not only attacks the red blood cell hemoglobin, but it also all the cells. High levels of exposure greatly diminish the body's ability to absorb oxygen.

Without immediate treatment, carbon monoxide poisoning is a leading cause of unintentional death by poisoning. Symptoms include dizziness, dull headache, weakness, irritability, nausea, impaired judgment, and loss of consciousness.

HYPERBARIC OXYGEN THERAPY HEALS BY:

- **Increasing the amount of oxygen available to the tissue to purge the poison from the body**
- **Speeding the delivery of oxygen to the blood**
- **Reducing any swelling in the brain**
- **Helping decrease potential neurological affects including confusion, mental impairment and brain damage**
- **Avoiding damage to the heart**
- **Preventing neurological disability or death**

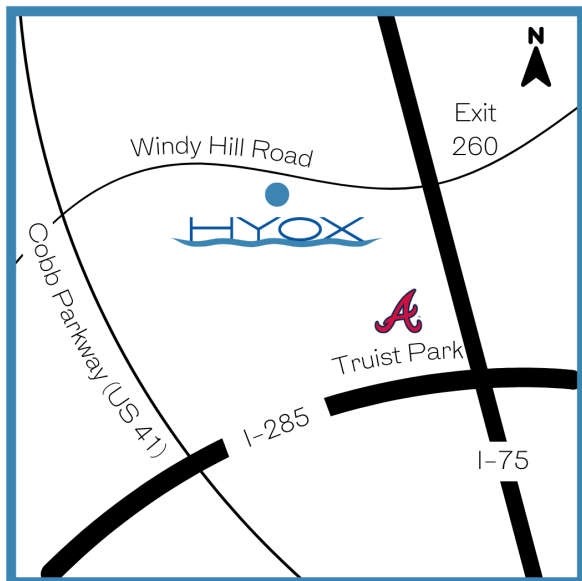

HYOX

HYPERBARIC MEDICINE HEALS.

HyOx is a comprehensive medical treatment center specializing in healing the body naturally by breathing 100 percent oxygen under pressure. Hyperbaric oxygen therapy increases oxygen content in the body by up to 1,500 percent to supersaturate every cell. This helps to fuel the healing process in patients with complications from cancer, infection, trauma, and wounds.
